

A large, continuous set of data (over 32000 samples) must be displayed as overlaid segments, as above, due to limitations of Excel.

For convenience, the overlay period used here is three days = 25920 samples.

Near the beginning of the graph, one of the PRS-10s shows evidence of being in seek mode.

Near the end of the third day, the changing of the PLL loop time constant (x4) caused both PRS-10s to reenter seek mode.
